

**Amendments to the Claims:**

Please amend claims 1, 11 and 20 as shown in the following listing of claims.  
This listing of claims will replace all prior versions, and listings, of claims in the  
5 application.

- 1    1. (currently amended) A communication partner device  
2                 which belongs to a communication system having at least two such  
3         communication partner devices and  
4                 which is designed to communicate with another communication  
5         partner device of the communication system over a first communication channel,  
6         wherein one of the two communication partner devices contains a communication  
7         enable information item which is used to enable communication between the one  
8         communication partner device and the other communication partner device over  
9         the first communication channel, and  
10                which is designed to interact with an electrical circuit, which  
11         circuit has circuit parts for forming communication means which are designed for  
12         contactless communication with communication means of the other  
13         communication partner device over a second communication channel and which,  
14         in the event of communication over the second communication channel, are  
15         designed to make available the communication enable information item, necessary  
16         for enabling communication over the first communication channel, in the  
17         communication partner device which prior to communication over the second  
18         communication channel does not yet contain the communication enable  
19         information item,  
20                wherein the electrical circuit includes a plurality of interfaces  
21         configured for communication over the first communication channel, the  
22         interfaces including at least two of a Bluetooth interface, an infra-red light  
23         interface, and a wireless large area network interface.
  
- 1    2. (previously presented) A communication partner device as claimed in  
2         claim 1, wherein the communication means are designed to make available the

3 communication enable information item directly after the start of communication  
4 over the second communication channel.

1 3. (previously presented) A communication partner device as claimed in  
2 claim 2,

3 wherein the communication means are designed, in the event of  
4 communication over the second communication channel, to communicate in  
5 accordance with a communication protocol, and

6 wherein the communication means are designed to make available  
7 the communication enable information item by using at least one of two activation  
8 commands of the communication protocol, which activation commands can be  
9 communicated between the two communication partner devices in accordance  
10 with the communication protocol as first commands over the second  
11 communication channel and are provided in order to activate communication in  
12 compliance with the communication protocol.

1 4. (previously presented) A communication partner device as claimed in  
2 claim 1,

3 wherein the communication means are designed to receive the  
4 communication enable information item, contained in the other communication  
5 partner device, over the second communication channel, and

6 wherein the circuit has a provision stage which is designed to  
7 provide the communication enable information item, received by the  
8 communication means, for enabling communication over the first communication  
9 channel.

1 5. (previously presented) A communication partner device as claimed in  
2 claim 1, wherein communication start means are provided which are designed to  
3 interact with the communication means and are designed to use the  
4 communication enable information item of the other communication partner  
5 device, which can be made available, to start communication with the other  
6 communication partner device over the first communication channel as soon as

7 the communication enable information item has been made available by the  
8 communication means.

1 6. (previously presented) A communication partner device as claimed in  
2 claim 1,

3 wherein the communication partner device has storage means  
4 which are provided for storing the communication enable information item  
5 contained therein, and

6 wherein the circuit has an interrogation stage which is designed to  
7 interrogate the communication enable information item stored in the storage  
8 means, and

9 wherein the communication means are designed to transmit the  
10 communication enable information item, which can be interrogated, to the  
11 communication means of the other communication partner device over the second  
12 communication channel.

1 7. (previously presented) A communication partner device as claimed in  
2 claim 1, wherein the communication enable information item contains an interface  
3 type information item which indicates the interfaces that are available in the  
4 communication partner device for communication over the first communication  
5 channel.

1 8. (previously presented) A communication partner device as claimed in  
2 claim 7, wherein the communication enable information item contains, in addition  
3 to the interface type information item, an interface preference information item  
4 which signifies one of the interfaces that is preferred in the communication partner  
5 device containing the communication enable information item.

1 9. (previously presented) A communication partner device as claimed in  
2 claim 1, wherein the communication enable information item contains an interface  
3 designation information item which signifies an interface that is available in the  
4 communication partner device containing the communication enable information

5 item, which interface is designed for communication over the first communication  
6 channel.

1 10. (previously presented) A communication partner device as claimed in  
2 claim 1, wherein the communication enable information item contains a  
3 communication partner designation information item which signifies the  
4 communication partner device that contains the communication enable  
5 information item.

1 11. (currently amended) A circuit for a communication partner device, which  
2 communication partner device belongs to a communication system having at least  
3 two such communication partner devices and is designed to communicate with  
4 another communication partner device the communication system over a first  
5 communication channel, wherein one of the two communication partner devices  
6 contains a communication enable information item which is used to enable  
7 communication between the one communication partner device and the other  
8 communication partner device over the first communication channel,

9                         which circuit has circuit parts for forming communication means  
10 which are designed for contactless communication with communication means of  
11 the other communication partner device over a second communication channel  
12 and which, in the event of communication over the second communication  
13 channel, are designed to make available the communication enable information  
14 item, necessary for enabling communication over the first communication  
15 channel, in the communication partner device which prior to communication over  
16 the second communication channel does not yet contain the communication  
17 enable information item,

18                         wherein the circuit includes a plurality of interfaces configured for  
19 communication over the first communication channel, the interfaces including at  
20 least two of a Bluetooth interface, an infra-red light interface, and a wireless large  
21 area network interface.

1 12. (previously presented) A circuit as claimed in claim 11, wherein the  
2 communication means are designed to make available the communication enable

3 information item directly after the start of communication over the second  
4 communication channel.

1 13. (previously presented) A circuit as claimed in claim 12,  
2 wherein the communication means are designed, in the event of  
3 communication over the second communication channel, to communicate in  
4 accordance with a communication protocol, and  
5 wherein the communication means are designed to make available  
6 the communication enable information item by using at least one of two activation  
7 commands of the communication protocol, which activation commands can be  
8 communicated between the two communication partner devices in accordance  
9 with the communication protocol as first commands over the second  
10 communication channel and are provided in order to activate communication in  
11 compliance with the communication protocol.

1 14. (previously presented) A circuit as claimed in claim 11,  
2 wherein the communication means are designed to receive the  
3 communication enable information item, contained in the other communication  
4 partner device, over the second communication channel, and  
5 wherein the circuit has a provision stage which is designed to  
6 provide the communication enable information item, received by the  
7 communication means, for enabling communication over the first communication  
8 channel.

1 15. (previously presented) A circuit as claimed in claim 11,  
2 wherein the circuit has an interrogation stage which is designed to  
3 interrogate the communication enable information item contained in the  
4 communication partner, and  
5 wherein the communication means are designed to transmit the  
6 communication enable information item, which can be interrogated, to the  
7 communication means of the other communication partner device over the second  
8 communication channel.

1 16. (previously presented) A circuit as claimed in claim 11, wherein the  
2 communication enable information item contains an interface type information  
3 item which indicates the interfaces that are available in the communication partner  
4 device for communication over the first communication channel.

1 17. (previously presented) A circuit as claimed in claim 16, wherein the  
2 communication enable information item contains, in addition to the interface type  
3 information item, an interface preference information item which signifies one of  
4 the interfaces that is preferred in the communication partner device containing the  
5 communication enable information item.

1 18. (previously presented) A circuit as claimed in claim 11, wherein the  
2 communication enable information item contains an interface designation  
3 information item which signifies an interface that is available in the  
4 communication partner device containing the communication enable information  
5 item, which interface is designed for communication over the first communication  
6 channel.

1 19. (previously presented) A circuit as claimed in claim 11, wherein the  
2 communication enable information item contains a communication partner  
3 designation information item which signifies the communication partner device  
4 that contains the communication enable information item.

1 20. (currently amended) A communication enabling method for enabling  
2 communication over a first communication channel between a communication  
3 partner device which belongs to a communication system having at least two such  
4 communication partner devices, and another communication partner device of the  
5 communication system, wherein one of the two communication partner devices  
6 contains a communication enable information item and

7 wherein the communication enable information item is used to  
8 enable communication between the one communication partner device and the  
9 other communication partner device over the first communication channel using  
10 one of a plurality of interfaces of the one communication partner device

11 configured for communication over the first communication channel, the  
12 interfaces including at least two of a Bluetooth interface, an infra-red light  
13 interface, and a wireless large area network interface, and

14 wherein contactless communication is effected over a second  
15 communication channel using communication means of the one communication  
16 partner device and using communication means of the other communication  
17 partner device and

18 wherein, in the event of such communication over the second  
19 communication channel, the communication enable information item, necessary  
20 for enabling communication over the first communication channel, is made  
21 available in the communication partner device which prior to communication over  
22 the second communication channel does not yet contain the communication  
23 enable information item.

1 21. (previously presented) A method as claimed in claim 20, wherein the  
2 communication enable information item is made available directly after the start  
3 of communication over the second communication channel.

1 22. (previously presented) A method as claimed in claim 21  
2 wherein, in the event of communication over the second  
3 communication channel, communication is effected in accordance with a  
4 communication protocol, and

5 wherein the communication enable information item, is  
6 communicated between the two communication partner devices in accordance  
7 with the communication protocol over the second communication channel by  
8 using at least one of two activation commands of the communication protocol,  
9 which activation commands are transmitted as first commands of the  
10 communication protocol in order to activate communication in compliance with  
11 the communication protocol.

1 23. (previously presented) A method as claimed in claim 20,  
2                   wherein, with the aid of the communication means, the  
3 communication enable information item is received over the second  
4 communication channel and  
5                   wherein, with the aid of a provision stage which is designed to  
6 provide the communication enable information item received by the  
7 communication means, the communication enable information item for enabling  
8 communication over the first communication channel is provided.

1 24. (previously presented) A method as claimed in claim 20, wherein, with the  
2 aid of communication start means which are designed to interact with the  
3 communication means and are designed to use the communication enable  
4 information item of the other communication partner device, which has been  
5 provided, to start communication with the other communication partner device  
6 over the first communication channel, communication with the other  
7 communication partner device over the first communication channel using the  
8 communication enable information item which has been made available is started  
9 as soon as the communication enable information item has been made available by  
10 the communication means.

1 25. (previously presented) A method as claimed in claim 20,  
2                   wherein, with the aid of an interrogation stage which is designed to  
3 interrogate the communication enable information item stored in storage means of  
4 the one communication partner device, the stored communication enable  
5 information item is interrogated by the storage means and  
6                   wherein, with the aid of the communication means, the  
7 communication enable information item, which has been interrogated by the  
8 storage means, is transmitted to the communication means of the other  
9 communication partner device over the second communication channel

1       26. (previously presented) A method as claimed in claim 20, wherein the  
2       communication enable information item contains an interface type information  
3       item which indicates the interfaces that are available in the one communication  
4       partner device for communication over the first communication channel.

1       27. (previously presented) A method as claimed in claim 26, wherein the  
2       communication enable information item contains, in addition to the interface type  
3       information item, an interface preference information item which signifies one of  
4       the interfaces that is preferred in the communication partner device containing the  
5       communication enable information item.

1       28. (previously presented) A method as claimed in claim 20, wherein the  
2       communication enable information item contains an interface designation  
3       information item which signifies an interface that is available in the  
4       communication partner device containing the communication enable information  
5       item, which interface is designed for communication over the first communication  
6       channel.

1       29. (previously presented) A method as claimed in claim 20, wherein the  
2       communication enable information item contains a communication partner  
3       designation information item which signifies the communication partner device  
4       that contains the communication enable information item.
